

## LIST OF FIGURES

FIGURE	PAGE
1.1 Fracture process zone in concrete	1
1.2 Typical tensile response of concrete	2
1.3 Uniaxial tension test of a concrete specimen	3
2.1 Smearred and discrete crack finite element concepts	7
3.1 Crack angle $\theta$	12
3.2 A crack as a singular band between two singular lines	14
3.3 A singular band in a finite element mesh	15
4.1 Storage of profile symmetric matrix	20
4.2 Illustration of node renumbering	21
4.3 Coding of different node numberings	22
4.4 Schematic diagram of crossover of node numberings	23
4.5 Schematic diagram of mutation of node numbering	23
4.6 Finite element mesh of plate using eight-noded quadrilateral elements	24
4.7 Original system stiffness matrix of mesh A	25
4.8 Relationship between average of fitness values and number of generations	25
4.9 Relationship between optimum and average of storages and generations	25
4.10 The optimum solution in various generations	27
4.11 Final system stiffness matrix comparing the genetic algorithm with graph theory	28
4.12 Mesh topology and original system stiffness matrix of mesh B	29
4.13 Relationship between optimum and average of storage and generations	29
4.14 Final system stiffness matrix comparing the genetic algorithm with band width reduction	30
4.15 Finite element meshes for the analysis of cracking localization in four-point bending test	31
5.1 A problem with one cracked element surrounded by intact elastic elements	34
5.2 Uniaxial problem using two 1-D elements	37
5.3 The shape function for a linear two-noded line element	38
5.4 Schematic responses of the uniaxial problem using one-dimensional bar elements	41
6.1 Uniaxial tension tests and its load-deformation curve	43
6.2 Examples of coding of crack patterns	44
6.3 A roulette wheel marked for four individuals according to their $\Delta\Pi$	45
6.4 One-point crossover	46
6.5 Two-point crossover	46
6.6 Uniform crossover	46
6.7 Mutation crossover	47
7.1 Direct tension test of a bar with notches on one edge	49
7.2 Finite element mesh for the direct tension test with notches	50
7.3 Load-controlled displacement response and crack patterns	51
7.4 Four-point bending problem of plain concrete	52
7.5 Finite element mesh for four-point bending problem	52
7.6 Specimen with different numbers of allowable crack paths	53
7.7 Load-controlled displacement responses and crack patterns	55
7.8 Crack patterns of specimen with 31 allowable crack paths	56

<b>FIGURE</b>	<b>PAGE</b>
7.9 Four-point bending problem of steel-fiber-reinforced concrete	57
7.10 Specimen with different numbers of allowable crack paths	58
7.11 Load-controlled displacement responses and crack patterns	59
A.1 Relationship between optimum and average of storages and generations of mesh C1	A-2
A.2 Relationship between optimum and average of storages and generations of mesh C2	A-2
A.3 Relationship between optimum and average of storages and generations of mesh C3	A-3
A.4 Relationship between optimum and average of storages and generations of mesh C4	A-3
B.1 Stress components and principal angle	B-2
C.1 Crack pattern of case with 1 allowable crack path in plain concrete specimen	C-2
C.2 Crack pattern of case with 5 allowable crack paths in plain concrete specimen	C-3
C.3 Crack pattern of case with 13 allowable crack paths in plain concrete specimen	C-4
C.4 Crack pattern of case with 31 allowable crack paths in plain concrete specimen (cracking localization, without self-weight)	C-5
C.5 Crack pattern of case with 31 allowable crack paths in plain concrete specimen (cracking localization, self-weight)	C-6
C.6 Crack pattern of case with 31 allowable crack paths in plain concrete specimen (without cracking localization, without self-weight)	C-7
D.1 Crack pattern of case with 1 allowable crack path in SFRC specimen	D-2
D.2 Crack pattern of case with 31 allowable crack path in SFRC specimen	D-3
